

What doesn't work, snack bar and adding the parsed suggestion list to an adapter

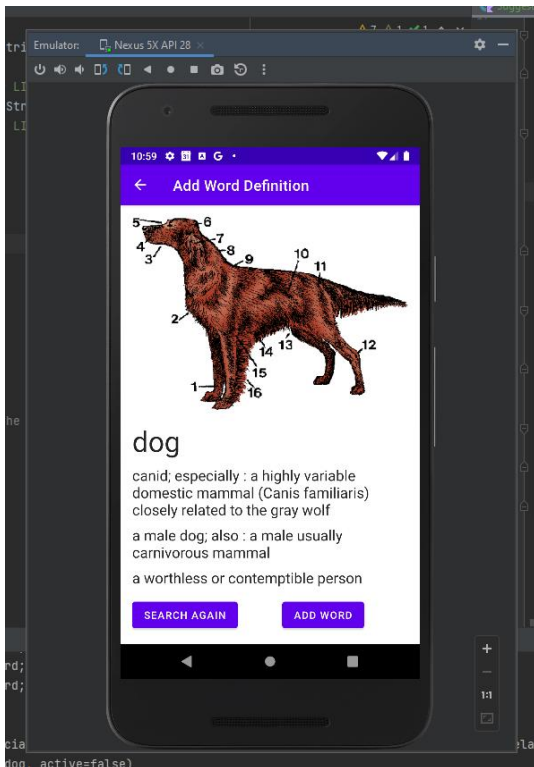

What works, everything else

This code is different because it puts the information into a card view and then the app is able to listen for swipe gestures to activate or deactivate each word. I also added a title header so user can know which filter is on

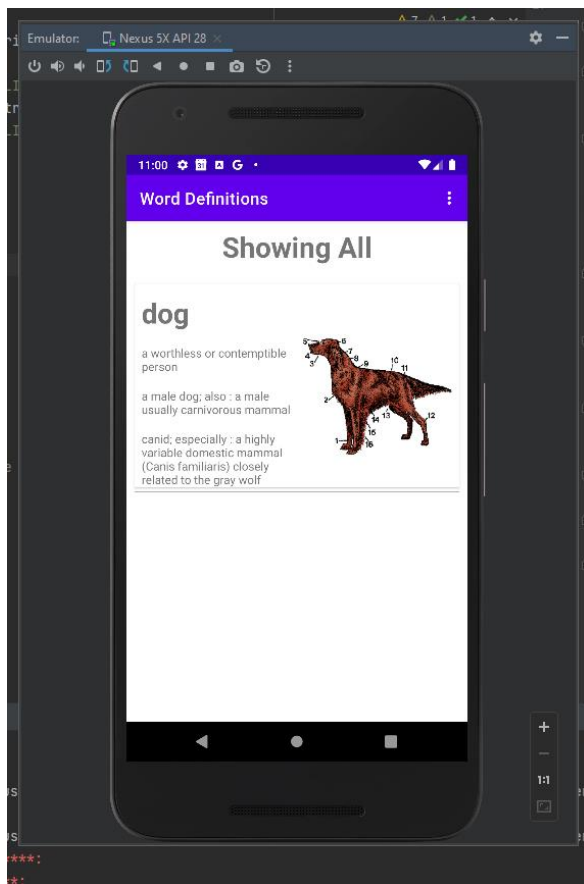

- First screen with empty DB

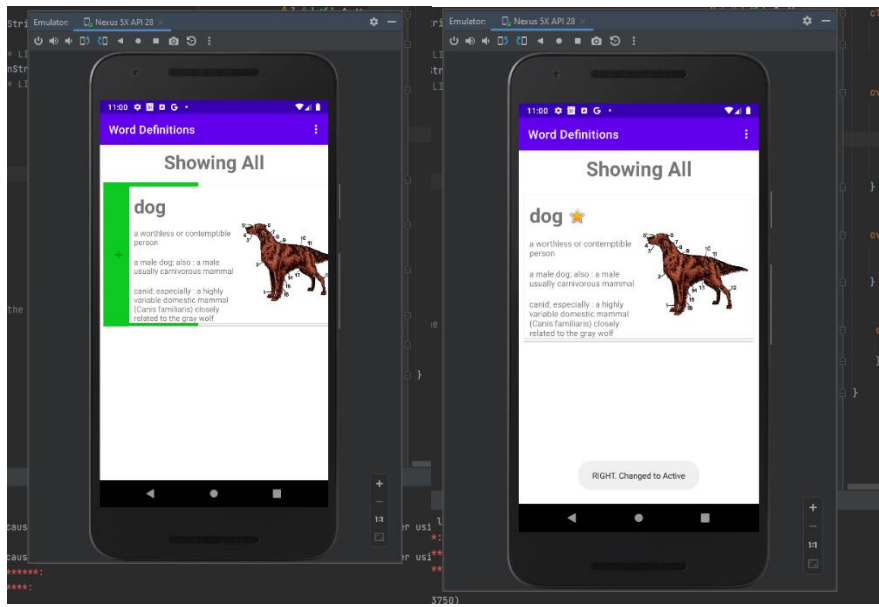

- After searching for a dog

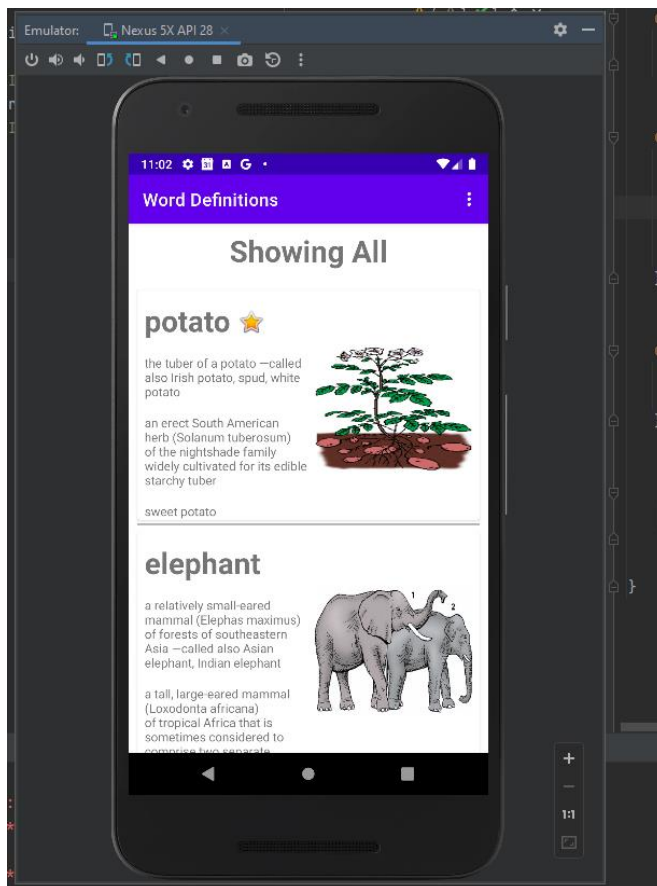

- Dog was added to the DB and showing as ALL and dog is auto assigned to not active

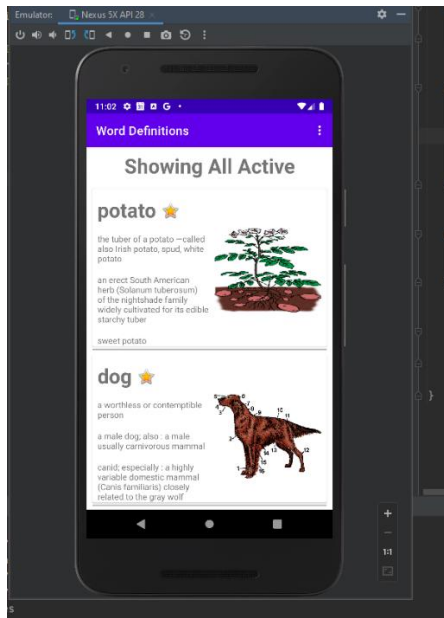

- Sliding card to be active -> active dog (star img to indicate)

- Show all filter

- Showing active filter

- Showing inactive filter
